*It is great and fantastic. Sure, it is actually perform, nevertheless an amazing and interesting literature. Once you begin to read the book, it is extremely difficult to leave it before concluding.*

Prof. James Hall had previously said of mountains, There is doubtless as much of the mass below the level of the sea as above it. -- Pat. New York, iii, Introduction. float; but he states elsewhere that the downward protuberances of the crust into the fluid substratum, which we have termed the roots of the mountains, will be gradually melted, and in this he is unquestionably correct. This must cause the mountain gradually to subside to the common level, or the elevation must be sustained arch-like, with the creation of strains in the contiguous crust. But as the mountains have not subsided, they must, therefore, consist of elevations without roots, and these elevated masses of matter, so far below the melting temperature, must be denser than the underlying fluid. Hence they should exert an excess of attraction on the pendulum, instead of a deficiency. It seems more probable that the elevations are sustained partly by flotation, and partly by lateral resistances of the crust, and...
